Date:2023-09-12

Aim:

S.No: 3

Five bikers compete in a race such that they drive at a constant speed which may or may not be the same as the other.

To qualify the race, the speed of a racer must be more than or equal to the average speed of all the 5 racers.

Take as input the speed of each racer and print back the speeds of qualifying racers.

Write a class [Race] with a method [main(String[] args)]. The main method receives five arguments. You can write code to parse them into [double] data type.

```
For example, if the values 54.55, 53.57, 54, 56.25, 57.30 are passed as arguments to the main() method, then the output should be

The speed of the racers >= average speed 55.134 : 56.25 57.3.
```

Note: Make sure to use the print() method and not the println() method.

Source Code:

```
Race.java
```

```
public class Race{
   public static void main(String args[]){
      double a,b,c,d,e,g,avg,f[];
      f=new double[5];
      a=Double.parseDouble(args[0]);
       b=Double.parseDouble(args[1]);
       c=Double.parseDouble(args[2]);
       d=Double.parseDouble(args[3]);
       e=Double.parseDouble(args[4]);
       avg=(a+b+c+d+e)/5;
       System.out.print("The speed of the racers >= average speed "+avg+": ");
       for(int i=0;i<5;i++)</pre>
         g=Double.parseDouble(args[i]);
         if(g>avg)
            System.out.print(","+g);
       }
   }
}
```

Execution Results - All test cases have succeeded!

```
Test Case - 1

User Output

The speed of the racers >= average speed 54.85599999999995: ,81.6,58.19,79.42
```

Test Case - 2
User Output
The speed of the racers >= average speed 78.0032: ,96.21,87.26,105.63
